

Automating Vulnerability Remediation without the Fear of Disruption.

The top two reasons vulnerability remediation teams give for patch delays are:

- ▀ Resource constraints
- ▀ Fear of breaking something

trackd is addressing both issues with a single platform.

The Vulnerability Remediation Reality

Less than 2% of patches are rolled back, meaning at least 98% are strong candidates for automation that would require little human involvement.

But remediation teams are justifiably reluctant to leverage auto-patching: that 2% can do a lot of damage if the wrong guess is made.

How Does trackd Help?

The trackd platform collects patching experience data across all users, anonymizes it, and shares it with all other users in real-time. So, trackd users can see how many times a given patch was applied, and more importantly, how often it caused a disruption.

trackd Enables Data-Driven Remediation Decision-Making

Armed with this real-world (and real-time) insight, remediation teams can maximize auto-patching with confidence, freeing precious resources for the 2% of patches that are best handled manually.

We're taking the guesswork out of vulnerability remediation.
