

Data-driven decision making with Perfectial's feasibility research

Our feasibility study will help define the issue your business seeks to tackle or the opportunity it strives to capitalize on.

Being a seasoned software development vendor, we offer vast expertise and fine-tuned processes to assess realistically and promptly the potential of your software project. We'll help "flesh out" the problem, explore viable solutions, reveal, early on, implementation challenges and mitigate technological risks.

Our research will save you time, money and heartache in the later development stages.

The goals of a feasibility study:

Establish the scope of the project

We'll help you "frame" the issue and give a clear focus to the project. Defining the scope clearly and stating the project's potential impact on various areas within the organization puts everyone on the same page.

Inspect your current system

It might so happen that an in-depth investigation will reveal that engineering an application from the ground up (to fix the issue at hand) isn't feasible and that the tools your company has been using can be made sufficient with slight modifications. If not, certain elements of the current system can still be replicated, built upon and put into new software to save costs and effort.

Specify requirements

Unveiling deep requirements, both in terms of technical implementation and user expectations, helps shut off erroneous assumptions. During the course of the feasibility analysis, we will conjointly map out your project's requirements for engineering, maintenance, DevOps skillsets, implementation, schedules, etc.

Find a suitable approach

We'll assess various implementation scenarios (that meet the requirements) and evaluate the strengths, weaknesses, and implications of each. After we've accumulated more information, we'll be able to unveil the risk/reward tradeoffs of pursuing different courses of actions as well as potential stumbling blocks that might negate the initiative.

Compile a report

Now, having concrete data to base decisions on, you can decide whether to move forward with the project, stop it at its tracks, or, possibly, request further clarification and analysis.

Why choose Perfectial?

We have a wide-ranging experience of conducting feasibility studies for companies of different sizes in various business verticals.

We cover everything from requirement specification to design description to software validation and verification reports; our early in-depth project analyses have proved to save clients costs and stress in the later development stages.

We'll identify every high risk associated with your project implementation (so you can better allocate efforts) as well as benefits different technologies bring.
